(54) Title: ELECTRONIC COMPONENT COMPRISING A RESONATOR ELEMENT IN A HERMETICALLY-SEALED CASE

(57) Abstract: The invention relates to an electronic component (1) comprising at least one resonator element (5) which is disposed in a housing (8) of a case. The aforementioned case comprises: a main part (2) with a base (20) and at least one annular lateral wall (3), and a cover (4) which is fixed to the main part in order to seal the housing of the case hermetically. Moreover, part of the cover is transparent to a determined wavelength of a light beam in order to enable the resonator element to be optically adjusted once the case is closed. According to the invention, the cover is fixed to a rim (7) of the lateral wall (3) of the preferably-ceramic main part, such that that part of the rim surrounds preferably all of the lateral surface of the cover (4) in order to ensure that the electronic component is protected against lateral impact.
